Application No.: 10/582,178 Filing Date: April 27, 2007

## AMENDMENTS TO THE CLAIMS

- 1. **(Original)** A genetic reference standard comprising at least one human genetic reference sequence cloned into a non-mammalian animal cell line.
- 2. **(Original)** The genetic reference standard of claim 1 wherein the animal cell line is an avian cell line.
- 3. **(Currently amended)** The genetic reference standard of claim 2 wherein the cell line is a chicken (*Gallus Callus spp.*) cell line.
- 4. **(Previously presented)** The genetic reference standard of claim 1 wherein the cell line is a B-cell line.
- 5. **(Original)** The genetic reference material of claim 3 wherein the chicken cell line is the chicken DT40 cell line.
- 6. (Previously presented) The genetic reference standard according to claim 1 wherein the at least one human genetic reference sequence is cloned into a dispensable region of the cell's genome.
- 7. **(Previously presented)** The genetic reference standard according to claim 1 wherein the at least one human genetic reference sequence is cloned into a non-expressed region of the cell's genome.
- 8. **(Previously presented)** The genetic reference standard according to claim 1 wherein the cloned cell line is diploid with respect to the human genetic reference sequence.
- 9. **(Previously presented)** The genetic reference standard according to claim 1 wherein the at least one human genetic reference sequence is a plurality of human genetic reference sequences.
- 10. **(Previously presented)** The genetic reference standard according to claim 1 wherein the or each human genetic reference sequence is not a functional chromosome.
- 11. (Withdrawn) A method of detecting a genetic variant in a sample containing human DNA comprising:

performing a test, responsive to DNA sequence, on said sample;

performing the same test on a reference sample embodying the genetic variant to be detected;

Application No.: 10/582,178
Filing Date: April 27, 2007

comparing the test results obtained from said sample and said reference sample to determine the presence or absence of said genetic variant; wherein said reference sample is a genetic reference standard according to claim 1.
